

# TAS-DME expansion anchor eyebolt

It works just like metal screw anchors. A hole must be drilled beforehand to place the anchor, then, the device is anchored to the walls of the base material by the pressure created by the expansion of the sleeve as the eyebolt is being threaded. The eyebolt fixes the element to be fastened or fixed using a cable, a pin or any other element that enables joining both elements.

**MATERIAL:** Eye, nut, washer, cone nut and sleeve:  
Carbon steel  
Plastic ring: Nylon  
Red color
