

The malleable structure of the wire rope clip is intended to make wire rope eyes or connections between wires where the wires cannot be crimped, or where temporary wire ends or links cannot be used. All wire rope clips are marked with the corresponding size on the outer side of the bridge, thus facilitating their identification.

TIPS: Wire rope clips must be retightened after the wire has been pulled the first time. The body of the wire rope clip must be assembled on the active part. The spacing between wire rope clips must be 6 mm x the wire diameter.

MATERIAL: Body - Malleable steel
Fork - Steel c15
FINISH: Galvanized
