EAR Clamps

Ear clamps are widely used in the assembly of irrigation systems where a quick fastening solution is required which prevents leaks, especially when joining or connecting pipes, tubes and hoses.

Once assembled Ear clamps are tamper-proof. The rounded edges prevent damage to hoses and tubes. If soft-walled hose is used, a version with an inner-ring is also available which protects the hose from pinching. Ear clamps can be used in applications with up to 46mm outer diameter.

ASFA Worm-Drive Clamp

The famous ASFA clamp covers any application requiring leaktightness in irrigation applications involving hoses.

Thanks to the design of its housing, the locking system and the positioning of the screw, we have improved the performance of the ASFA clamp without an increase in tightening torque.

SUPER Heavy-Duty Clamp

Super is one of the most widely-used clamps in irrigation systems due to its versatility and reliability in the distribution of water.

The Super clamp has a high-strength T-Bolt bolt which can be tightened using a variety of different tools.

SUPRA Heavy-Duty Clamp

Supra is the clamp of choice in high-pressure applications. The fact that it is available in diameters up to 408 makes it a very versatile option.

The exclusive design means that Supra can be assembled without removing the hose and without the loss of any accessories. The Supra clamp has bevelled edges which avoid damage to hoses and tubes.
