

The safety Torx spanner is a tool that is used to effectively thread all kinds of screws that have an imprint on the head similar to that of the aforementioned spanner. This type of spanner resists the "cam-out" effect that occurs when the screwdriver has a certain tightening torque and slips on the screw.

The presentation of the set in a case makes it possible to always have all the spanners located and without the possibility of losing them. It also makes it very easy to choose the size required depending on the application.

The L-shaped design of the spanners allows leverage during tightening to promote higher torque. The elbow of each spanner is 90 degrees. The entire structure of the spanners is round, except for the two ends which are machined with a torx imprint.

**MATERIAL:** Keys made of chrome vanadium steel 58CrV4 (1.8161)  
PVC case

**FINISH:** Blued keys  
Yellow case
