

This clamp is usually fixed to ceilings and enables to pass two parallel pipes of any desired diameter. It is fixed to the wall by means of a lag screw and a plug where the double clamp is screwed on.

It has two screws to open the clamp without having to detach it from the wall. This enables the pipes to be extracted or positioned. Its central ring reinforces the bridge and prevents it from bending during handling, thus ensuring a perfectly tight application. Widely used in sanitation, electrical and construction works.

**MATERIAL:** Steel  
**FINISH:** Zinc-Plated yellow
