

**MIKALOR**  
*Fasteners*

The Mikalor Group was founded with the aim of ensuring the specialization of each of the member companies and creating synergies in order to maximize our competitive advantage with respect to the competition.

One example of this specialization is that each of the companies in the Group is located in a different town within the province of Barcelona. Each company also has its own range and catalogue of products in order to guarantee a focus on productivity.

The areas of finance and human resources are handled centrally by the Mikalor Group.

The principal member companies of the Mikalor Group are: Mikalor Tools and Engineering, Mikalor Hose Clamps, Mikalor Fastening Solutions and Damesa.

- This catalogue is the property of the Mikalor Group. Any partial or total reproduction of any or all of its contents is strictly forbidden, unless written authorization is given by the Mikalor Group or any of the companies which form part of it. Failure to comply with this will lead to prosecution.
- Due to continuing technical advances and the evolution of materials used in the manufacture of the products in this catalogue, Mikalor reserves the right to carry out dimensional, structural or other modifications without giving prior notice, with the aim of supplying a better and more efficient product.
- This catalogue is for commercial use. The details contained herein do not constitute a contract in any way.

# MIKALOR

## MIKALOR

### TOOLS & ENGINEERING

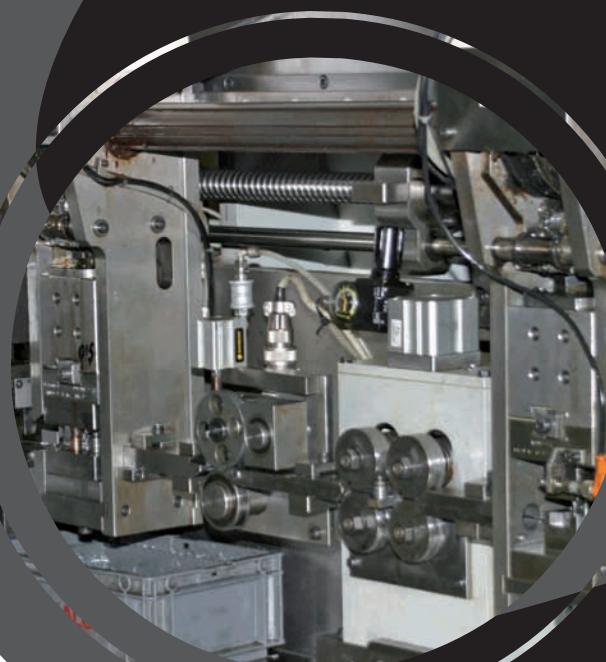

Situated in Sant Quirze del Vallès (Barcelona), Mikalor Tools and Engineering carries out two different but complementary activities. The first of these is their specialization in the development of technical projects, managed by the engineering department. The second activity is the manufacture of dies and machine tools for the manufacture of all Mikalor products and tooling for the manufacture of special parts according to the specifications of our customers. These machine tools are then sent to the Mikalor factory which specializes in the manufacture of the parts in question.

## MIKALOR

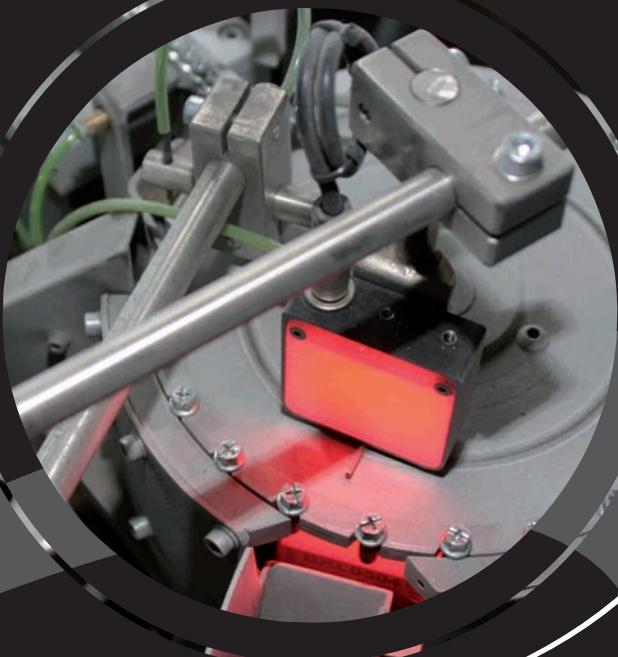

### FASTENING SOLUTIONS

Situated in Manresa (Barcelona), Mikalor Fastening Solutions is where our range of standard metal fasteners is manufactured. This range can be found in our fasteners catalogue. The parts manufactured here include DIN 1481 heavy-duty spring pins, cage nuts, U-nuts and chimney nuts. Special fasteners according to our customers' specifications are also manufactured here.

GRUPO

# MIKALOR

## MIKALOR

### HOSE CLAMPS

Situated in Sabadell (Barcelona), Mikalor Hose Clamps is responsible for the manufacture of the complete range of hose clamps, including special clamps manufactured according to customers' specifications.

In order to ensure top quality in the design and manufacture of our standard and special hose clips and clamps, our engineering department has the most advanced machinery available on the market. We carry out trialing and testing of the performance of our clamps, thereby ensuring that our customers' clamps will give optimum performance in their future application.

## damesa

Situated in Castellar del Vallès (Barcelona), Damesa is the branch of the Group specialized in sales, distribution and worldwide after-sales service of all the products manufactured by the member companies of the Mikalor Group.

Our sales department has an in-depth knowledge of the products manufactured by the Mikalor Group and also of the needs of our customer base. This is the key to the success of the Mikalor Group. The sales department is the ideal conduit for new and innovative solutions to existing problems, either by adapting a standard product or by developing a completely new one, thereby making sure that the customer receives the best solution at the lowest possible cost.

## DIN 6797 External tooth lock washer Form A

### Information

External tooth lock washers manufactured according to DIN 6797 allow the immobilization of fasteners such as bolts and screws which are subject to vibrations while maintaining uniform tightening torque, in any mechanical electrical or electronic application.

In addition to these anti-vibration properties, this washer also improves the quality of electrical circuits as each of the outer teeth forms an excellent point of contact.

The fact that Form A has teeth on the outer circumference of the washer means that there is uniform contact on the biggest possible surface area, thereby reducing the danger of loosening.

The surface of the bolt or screw should be flat and perpendicular to its vertical axis.

## DIN 6797 External tooth lock washer Form J

### Information

External tooth lock washers manufactured according to DIN 6797 allow the immobilization of fasteners such as bolts and screws which are subject to vibrations while maintaining uniform tightening torque in any mechanical electrical or electronic application.

Form J is particularly recommended when the angle of the internal chamfer of the head of the bolt or screw is pronounced and in all cases where the head of the screw or bolt is smaller than the diameter of the washer. This washer should also be used when the surface of the fastener is irregular or convex.

## DIN 6798 Serrated lock washer with external teeth Form A

### Information

External tooth lock washers manufactured according to DIN 6798 allow the immobilization of fasteners such as bolts and screws which are subject to vibrations while maintaining uniform tightening torque in any mechanical, electrical or electronic application. In addition to these anti-vibration properties, this washer also improves the quality of electrical circuits as each of the outer teeth forms an excellent point of contact. This washer is recommended for use in inaccessible application zones where it may be difficult to tighten the bolt or screw once fitted.

The fact that Form A has teeth on the outer circumference of the washer means that there is uniform contact on the biggest possible surface area, thereby reducing the danger of loosening.

The surface of the bolt or screw should be flat and perpendicular to its vertical axis.

The permanent inclination of the teeth, which are superimposed one upon the other around the circumference of the washer, gives a very high friction factor allowing for progressive and evenly distributed tightening torque around the head of the bolt or screw.

The tightening torque applied on the teeth of this washer should in no case exceed the recommended tightening torque for 8.8 class bolts.

When tightening torque is applied, the edges of the teeth of this washer are incrusted in the head of the bolt or screw, forming an immobile unit resistant to loosening.

## DIN 6798 Serrated lock washer with external teeth Form V

### Information

External tooth lock washers manufactured according to DIN 6798 allow the immobilization of fasteners such as bolts and screws which are subject to vibrations while maintaining uniform tightening torque in any mechanical, electrical or electronic application. In addition to the anti-vibration characteristic, this washer also improves the quality of electrical circuits as each of the outer teeth forms an excellent point of contact. This washer is recommended for use in inaccessible application zones where it may be difficult to tighten the bolt or screw once fitted.

Form V is recommended for use when the head of the bolt is at 90° to the vertical axis.

The permanent inclination of the teeth, which are superimposed one upon the other around the circumference of the washer, gives a very high friction factor allowing for progressive and evenly distributed tightening torque around the head of the bolt or screw. The tightening torque applied on the teeth of this washer should in no case exceed the recommended tightening torque for 8.8 class bolts.

When tightening torque is applied the edges of the teeth of this washer are incrusted in the head of the bolt or screw, forming an immobile unit resistant to loosening.

## **ADD Double-toothed lock washer**

### **Information**

This washer is used in panel assembly using holes and grooves which are much bigger than the diameter of the screw or bolt, in order to achieve evenly distributed pressure over the entire area of contact. The ADD washer is also very useful when fastening two panels together. Lateral movement can be avoided as the panels remain fixed in a static position.

The diameter of the washer chosen should be far greater than the diameter of the hole or groove in order to ensure sufficient contact area. The advantage of the use of the ADD washer is that the specific pressure is spread over a greater surface area in materials which are softer than steel.

## AET Serrated disc washer for DIN 912 bolts

### Information

The AET washer was designed specifically for applications where the outer diameter of the washer cannot exceed that of the bolt head.

Thanks to the conical form of this washer, the tightening torque is spread evenly in all applications. The serrated surfaces are incrustated into the head of the bolt or screw and also into the surface of the part which is being fastened, forming an immobile unit resistant to loosening if subjected to vibration.

This washer is suitable for use with a wide range of screws and bolts. It is very useful for use in mechanical assemblies where a locking function is essential. The elasticity of this washer compensates for axial forces avoiding lateral movement and unwanted grating noises.

The AET washer is particularly recommended for use for bolts manufactured according to DIN 74 and DIN 912 due to the perfect fit.

White Zinc-Plated

## DIN 137 Curved spring washer (Form A)

### Information

This washer is used in assemblies involving aluminium, plastic parts or insulating material etc. It is also recommended for locking assemblies where there is danger of damage to a painted or enameled surface. In electronics applications this washer is used to immobilize electrical contacts. Moderate tightening torque should be used with this washer.

## DIN 137 Wave spring washer (Form B)

### Information

This washer is used in assemblies involving aluminium, plastic parts or insulating material etc. It is also recommended for locking assemblies where there is danger of damage to a painted or enameled surface. In electronics applications this washer is used to immobilize electrical contacts. This washer can be used with bolts requiring high tightening torque.

## **ANR Internal ribbed automotive washer**

### **Information**

The ANR washer should be used when the diameter of the washer chosen has to be far greater than the diameter of the hole or groove in order to ensure sufficient contact area. The advantage of the use of the ANR washer is that the specific pressure is spread over a greater surface area in materials which are softer than steel. This washer is used in panel assembly using holes and grooves which are much bigger than the diameter of the screw or bolt, in order to achieve evenly distributed pressure over the entire area of contact. It is also recommended for assembly where a spring function is required, as the conical form of this washer allows the teeth of this washer to lock into the screw or bolt.

## DIN 6799 E-type circlip

### Information

The DIN 6799 circlip can be used in many different applications and is particularly useful with small diameter axles and shafts as it can handle high radial forces.

The design of the inner edge allows DIN 6799 to reach the very bottom of the groove, meaning that unnecessary wear and tear caused by movement due to a poor fit can be avoided.

**CIRCLIPS**

## DIN 471-E External Circlip

### Information

The DIN 471-External circlip is the most common form of safety device for shafts with external grooves. The DIN 471 Circlip is used to fasten elements such as freewheels or levers to shafts. It can transmit considerable axial forces from the part of the machine which exerts the force to the groove in which the circlip is fitted.

F = Phosphated

## DIN 472-I Internal Circlip

### Information

The DIN 472-Internal circlip is the most common form of safety device for shafts with internal grooves. It can transmit considerable axial forces from the part of the machine which exerts the force to the groove in which the circlip is fitted.

### DIN 472-E External Circlip

## Heavy-duty spring pin

### Information

A spring pin is a hollow cylinder which has a longitudinal slit from one end to the other. It has a diameter greater than the nominal diameter of the circular slot where it is to be fitted. When the spring pin is introduced in the hole it is compressed and retained due to the elastic force which it exerts on the walls of the slot. The longitudinal slit narrows but stays slightly open.

## Heavy-duty spring pin

### Information

A spring pin is a hollow cylinder which has a longitudinal slit from one end to the other. It has a diameter greater than the nominal diameter of the circular slot where it is to be fitted. When the spring pin is introduced in the hole it is compressed and retained due to the elastic force which it exerts on the walls of the slot. The longitudinal slit narrows but stays slightly open.

**NUTS**

## Standard cage nut

### Information

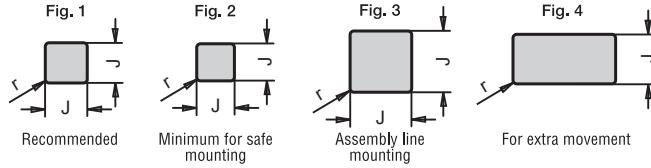

Cage nuts combine the classic elastic properties of fasteners used for assembly with the strength of multi-threaded steel nuts. Cage nuts are designed to be used in any kind of assembly including blind assemblies and are particularly common in equipment racks. They can be fastened within their housing using bolts and subjected to considerable tightening torque or axial forces. No special tools or specialized fitters are required to mount these nuts. The use of cage nuts allows for a great reduction in assembly time, as costly operations such as tapping, welding or riveting can be avoided. Due to the fact that the nuts are slightly loose within the cage, minor adjustments in the alignment of the parts to be assembled are possible.

The cage of this model of nut fits into the assembly position within a square or rectangular hole and due to the elasticity and design of its wings it can be used with a wide range of panel thicknesses. Once mounted in the rectangular hole the cage stays in place while the captive nut can move within the cage to permit assembly.

## Front-mounted cage nut

### Information

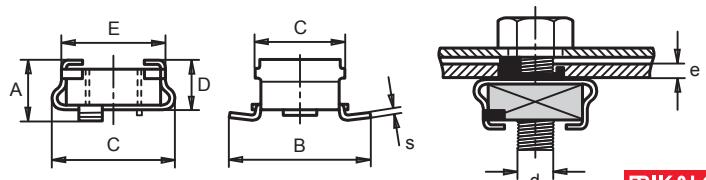

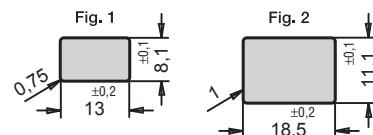

Cage nuts combine the classic elastic properties of fasteners used for assembly with the strength of multi-threaded steel nuts. Cage nuts are designed to be used in any kind of assembly including blind assemblies and are particularly common in equipment racks. They can be fastened within their housing using bolts and subjected to considerable tightening torque or axial forces. No special tools or specialized fitters are required to mount these nuts. The use of cage nuts allows for a great reduction in assembly time, as costly operations such as tapping, welding or riveting can be avoided. Due to the fact that the nuts are slightly loose within the cage, minor adjustments in the alignment of the parts to be assembled are possible.

Front-mounted cage nuts are particularly recommended for use with rigid structures with open or tubular frames and in blind assemblies. They can easily be slotted into the mounting hole and can then be moved within the housing using a simple aligning punch. They can also be removed immediately by reversing the process. The longer of the two tongues incorporates a small step which eliminates the gap between panels.

HRC 40-47 (HV 390-470)

### Surface treatment:

Anti-rust oil-dipped

## Cylindrical cage nut

### Information

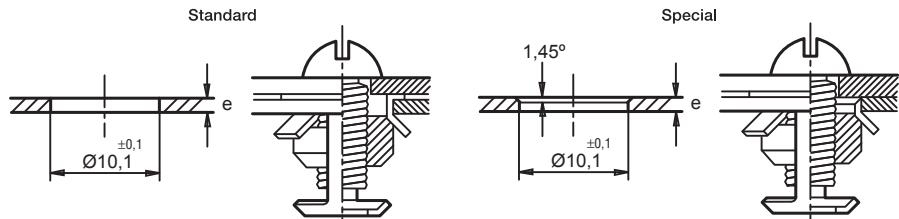

Cage nuts combine the classic elastic properties of fasteners used for assembly with the strength of multi-threaded steel nuts. Cage nuts are designed to be used in any kind of assembly including blind assemblies and are particularly common in equipment racks. They can be fastened within their housing using bolts and subjected to considerable tightening torque or axial forces. No special tools or specialized fitters are required to mount these nuts. The use of cage nuts allows for a great reduction in assembly time, as costly operations such as tapping, welding or riveting can be avoided. Due to the fact that the nuts are slightly loose within the cage, minor adjustments in the alignment of the parts to be assembled are possible.

Cylindrical cage nuts are designed to be in assemblies where the only access is in the front of the panel. They are designed to be fitted on an assembly line into circular punched or drilled mounting holes. As the bolt is tightened the cylindrical mild steel walls of this nut expand until it fits tightly within the mounting hole. For this reason the cylindrical cage nut is not re-usable. It is recommended for use in panels with a wide range of different thicknesses.

## Clip cage nut

### Information

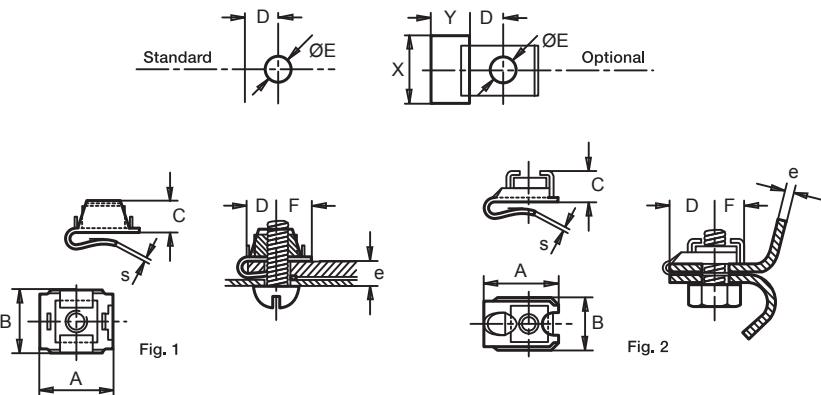

Cage nuts combine the classic elastic properties of fasteners used for assembly with the strength of multi-threaded steel nuts. Cage nuts are designed to be used in any kind of assembly including blind assemblies and are particularly common in equipment racks. They can be fastened within their housing using bolts and subjected to considerable tightening torque or axial forces. No special tools or specialized fitters are required to mount these nuts. The use of cage nuts allows for a great reduction in assembly time, as costly operations such as tapping, welding or riveting can be avoided. Due to the fact that the nuts are slightly loose within the cage, minor adjustments in the alignment of the parts to be assembled are possible.

Clip cage nuts can slide easily along a panel edge whether is level or inclined. They can also be mounted within rectangular mounting holes in the middle of a panel. In smaller dimensions alignment and retention are ensured using a lip which fits into the mounting hole, allowing the nut to slide into the correct position and keeping it in place.

## TNI Cage nut for leveling

### Information

The cage nut for leveling offers a safe and vibration-resistant solution for the fixing of adjustable feet in the white goods and furniture industries and for general industrial applications. These nuts can easily be push-mounted on the outer surface of the support or frame on an assembly line after painting or enameling has taken place. The pressure exerted by the wings of the cage help to keep the nut fixed in place.

### Mounting Holes

## TRS Flat spring nut

### Information

The Flat spring nut is a fastener composed of two raised thread forms which give double elastic pressure. The bow of the base and the arched form of the thread forms mean that two different forces are applied gradually to the screw when tightened. Radial force A is produced by the pressure of the thread forms deep into the thread while axial force B is exerted upon the outside of the thread due to the compression of the thread forms onto the base.

No special tools are required to mount this nut and it is quicker and easier to mount than conventional nuts. As it is self-locking, costly operations such as tapping, welding or riveting are avoided. It can also be used with fragile materials such as glass, plastic or enameled surfaces. In these cases the resilience of the nut avoids cracks or damage to the application area. This nut locks with tightening torques which much lower than for standard nuts due its great resilience.

## TR U-nut for DIN 7970 threaded bolts

### Information

The TR U-nut is a fastener composed of two flaps in clip form with two external raised thread forms. The design of this nut means that a double elastic force is exerted when tightened. This nut can be held in place manually when tightening. No special tools are required to mount U-nuts, and they can be assembled much more quickly and easily than conventional nuts. The self-locking feature means that costly operations such as tapping, welding or riveting can be avoided. It can also be used with fragile materials such as glass, plastic or enameled surfaces. In these cases the resilience of the nut avoids cracks or damage to the application area.

This nut locks with tightening torques much lower than for standard nuts due to its great resilience. It is normally mounted on the edge of a panel but it can also be used in a rectangular mounting hole in the middle of a panel. Thanks to the extremely wide range of Mikolor U-nuts, designers can choose amongst an infinite number of different dimensions, panel thicknesses and screw sizes. The fact that the U-nut allows slight adjustment within the mounting hole ensures correct alignment of the panels.

## TRU Universal speed nut

### Information

The TRU Universal speed nut is a fastener composed of two flaps in clip form with an external raised thread form. The design of this nut means that a double elastic force is exerted when tightened. The upper flap has a longitudinal slit on either side forming struts which increase the grip of the nut onto the panel. This nut is designed to be used with DIN 7970 bolts or bolts with an ACME thread depending on the model chosen.

TRU locks with tightening torques much lower than for standard nuts due to its great resilience. The wide range available means that designers can choose amongst an infinite number of different dimensions, panel thicknesses and screw sizes.

No special tools are required to mount U-nuts, and they can be assembled much more quickly and easily than conventional nuts and costly operations such as tapping, welding or riveting can be avoided. They are normally mounted on the edge of a panel but can also be used in a rectangular mounting hole in the middle of a panel. The fact that the U-nut allows slight adjustment within the mounting hole ensures correct alignment of the panels.

## TRT-T Chimney (Lug) nut

### Information

The TRT chimney nut is a fastener composed of two flaps in clip form. The design of this nut means that a double elastic force is exerted when tightened.

In the middle of the upper flap there is a hollow cylinder or "chimney" with multiple threads which when given the correct torque guarantees maximum fastening and assembly strength. The lower flap incorporates a third flap which is set in the opposite direction to the outer flaps in order to ensure optimum grip on the panel.

Depending on the assembly two types of thread are available: normal or self-locking.

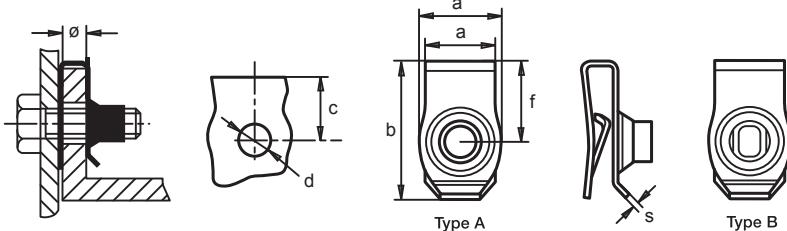

No special tools are required to mount chimney nuts, and they can be assembled much more quickly and easily than conventional nuts and costly operations such as tapping, welding or riveting can be avoided. They are normally mounted on the edge of a panel but can also be used in a rectangular mounting hole in the middle of a panel. The use of this nut allows slight adjustment within the mounting hole thereby ensuring correct alignment of the panels.

## TRO Expansion speed nut

### Information

The TRO Expansion speed nut is a self-locking nut which is both very safe and very resistant to vibration. It was designed specifically for blind assemblies which are only accessible from one side and can be mounted in the centre or around the edge of a panel.

It is also widely used in the assembly of rigid structures with open or tubular frames. It can be front-mounted easily with a little pressure and thanks to a slight step built into the body of the nut the distance between panels is avoided.

### TRO Expansion speed nut

# SPECIAL FASTENERS

## SRM Circular uncapped push-on fastener for shafts

### Information

The SRM push on fastener is a one-use fastener designed for use in assemblies which are not normally dismounted, as in order to do this it would be necessary to break the SRM.

It is normally fitted to shafts with no groove but it can also be used with grooved shafts, which would help to improve its resistance to axial forces.

It is used in applications which do not require great force such as electrical devices, electricity, gas or water meters, measuring instruments, etc.

## CL Shaft clip

### Information

The CL shaft clip is particularly useful for use with small diameter shafts as it can handle quite considerable axial forces.

The design of the inside edge allows the CL clip to reach the very bottom of the groove, meaning that unnecessary wear and tear caused by movement due to a poor fit can be avoided.

The frontal flap forms a convenient grip which makes CL much easier to mount than other more conventional shaft clips.

## SCB Compression ring

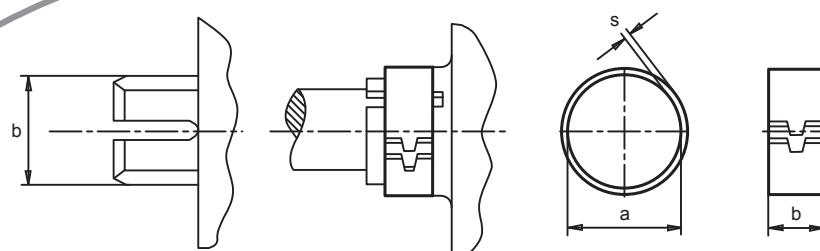

### Information

The SCB compression Ring is a cylindrical band which has a lateral cut in the form of a tooth. This form allows the ring to be mounted on the shaft and to produce the necessary compression to avoid any radial movement between the components which have been fastened together. This ring is especially useful for fixing buttons and knobs in electronic and white goods applications.

## SCO Cable clip

### Information

The SCO cable clip is a fastener which can be mounted manually on the outside edge of a panel at any point in an assembly line. SCO is both removable and reusable. Due to its flexibility, it can be used to fasten rods, cables, pipes, conduits etc in complete safety and with a wide range of different application diameters.

It has many general industrial applications but is particularly useful in automotive, electronics and white-goods applications.

## CLS Safety clip

### Information

The CLS Safety Clip is a fastener composed of two flaps in clip form which is mounted externally. One of the flaps is open at the bottom and is slightly curved in order to fit snugly into the groove of the shaft, while the second flap fits onto the shaft itself. This clip can only be fitted on shafts with a groove at the end of the shaft. This clip is generally used in automotive applications.

## Spring steel panel latch

### Information

The SRV Spring steel panel latch is a very useful fastener for use with movable panels and doors in combination with a door or panel stud. Form A is fastened to the panel using a threaded fastener or rivet while Forms B and C fit onto the panel and hold themselves in place due to their spring-mounting feature.

## SCL Tubular clip

### Information

The SCL Tubular Clip is one of a sub-group of fasteners which are used in conjunction with rivets. They can be compared to self-locking nuts for blind assemblies and are used where other fasteners cannot be applied. There are two varieties of SCL:

**Self-Locking:** The tubular clip is inserted into the corresponding hole in the panel. A rivet is then inserted which causes the clip to open, fixing it into the panel.

**Removable:** the top of the clip flares out exerting pressure on the rivet.

## GRU Edge clip

### Information

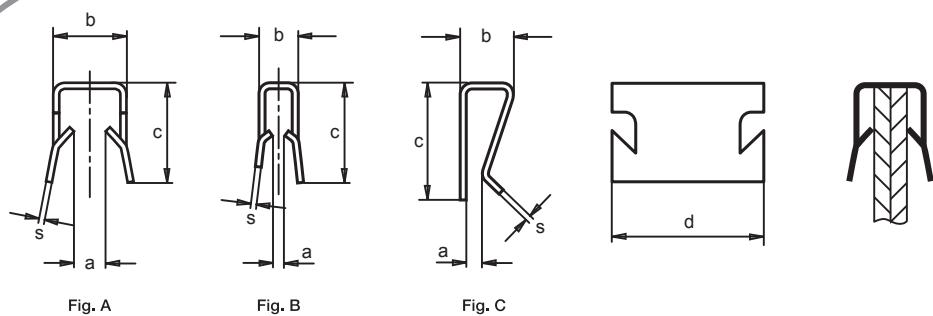

The GRU Edge Clip is a fastener composed of two flaps in clip form which is mounted externally by applying pressure to both sides. Some models incorporate a spike on the inside of one of the flaps which helps to ensure a good grip. In automotive applications these clips are used to fasten upholstery, mats and similar parts.

## DIN 6799 Assembly tools

### Information

#### Instructions:

- 1.- Remove the plastic cap from the cartridge
- 2.- Insert the narrow end of the cartridge into the slit in the application device, making sure that the spike goes down until it can go no further. Turn the knob on the front of the device clockwise until the cartridge is held firm in a vertical position
- 3.- Insert the fork (with the stamped number facing upwards) into the corresponding slot and push it in as far as it will go.
- 4.- Remove the fork. A DIN 6799 circlip is now held between the two prongs of the fork and is now ready to be slotted into the groove on the shaft.

## TOOLS & ENGINEERING

Mikalor Tools & Engineering, based in Sant Quirze del Vallès, was founded with the aim of specializing in the design and construction of progressive stamping dies with elements of plate bending and pressing for all the companies which belong to the Mikalor Group.

There are many companies in the market manufacturing progressive dies, but when quality is at stake, time is of the essence and technical backup is a must, you really have to look for a supplier you can trust. Mikalor Tools & Engineering guarantees total reliability and state of the art products.

We are geared towards maximum reliability in each of the processes we are involved in. Our highly skilled workforce has great experience in the manufacture of progressive dies and has the latest and most modern technology at their disposal.

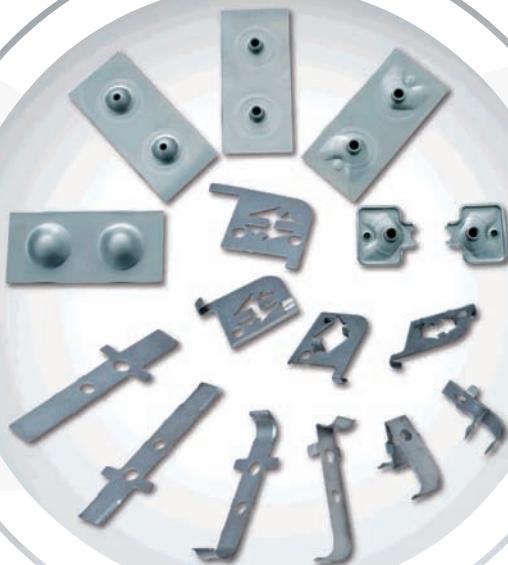

## PROJECTS

All of our projects start with a request from one of our customers to create, improve or simplify the development of a fastener. Our technological capacity, channeled via the engineering department, allows us to propose the best design solution and suggest how to get the best out of a die or machine tool. In order to do this, we use state of the art 2 dimensional and 3 dimensional computer aided design programs.

## PROTOTYPES

The fact that we can supply prototypes very quickly means that we can collaborate actively with the engineering departments of our customers, analyzing all the variables involved in assembly, and together decide on the most appropriate improvements to the fastener. This partnership also helps us to ensure that the fastener we design is totally functional and cost-effective.

## DIES

When manufacturing a progressive die it is of paramount importance to use the correct design for the die in question in order to get the most from the process. This is true whether it is a cutting die or a progressive die with elements of plate bending or pressing. The technology of the machine is also vital, as are the materials used.

Our knowledge, experience and technology allow us to manufacture progressive dies of up to 4 metres in length, with more than 18 different bending and pressing processes in only one drop and with tolerances of +/- 0,001mm

## SPARE PARTS

Our spare parts department is responsible for supplying all the necessary spare parts to ensure that our dies are in perfect working order again in a maximum of 96 hours. We can do this thanks to the machinery we use and our years of experience in the manufacture of a wide variety of spare parts. This means that the spare parts we supply will not need minor adjustments and will be able to guarantee reliability in productivity.

## ACCESSORIES FOR PRESSES AND AUTOMATION

In order to help our customers to increase productivity in their mechanical manufacturing processes and in the assembly of the fasteners manufactured by Mikalor Fastening Solutions, our engineering department studies the process in order to supply the most convenient automation solution.

At the same time, we also have standard band conveyors for presses and machinery, with a maximum bandwidth of 300mm, thicknesses up to 2,5mm top speed of 300mm/min and with a precision of +/- 0,01mm
